## Language Reference

Arduino programs can be divided in three main parts: *structure*, *values* (variables and constants), and *functions*.

### Structure

- [setup\(\)](#)
- [loop\(\)](#)

### Control Structures

- [if](#)
- [if...else](#)
- [for](#)

### Variables

#### Constants

- [HIGH | LOW](#)
- [INPUT | OUTPUT | INPUT\\_PULLUP](#)
- [LED\\_BUILTIN](#)
- [true | false](#)
- [integer constants](#)

### Functions

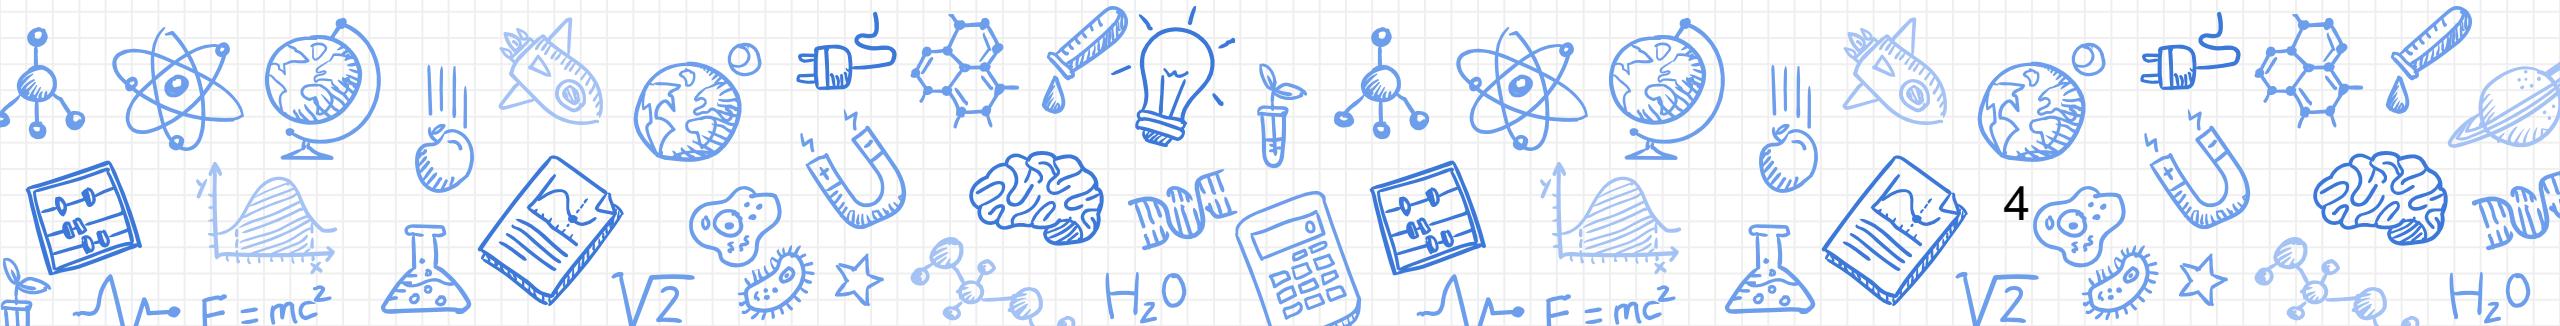

#### Digital I/O

- [pinMode\(\)](#)
- [digitalWrite\(\)](#)
- [digitalRead\(\)](#)

#### Analog I/O

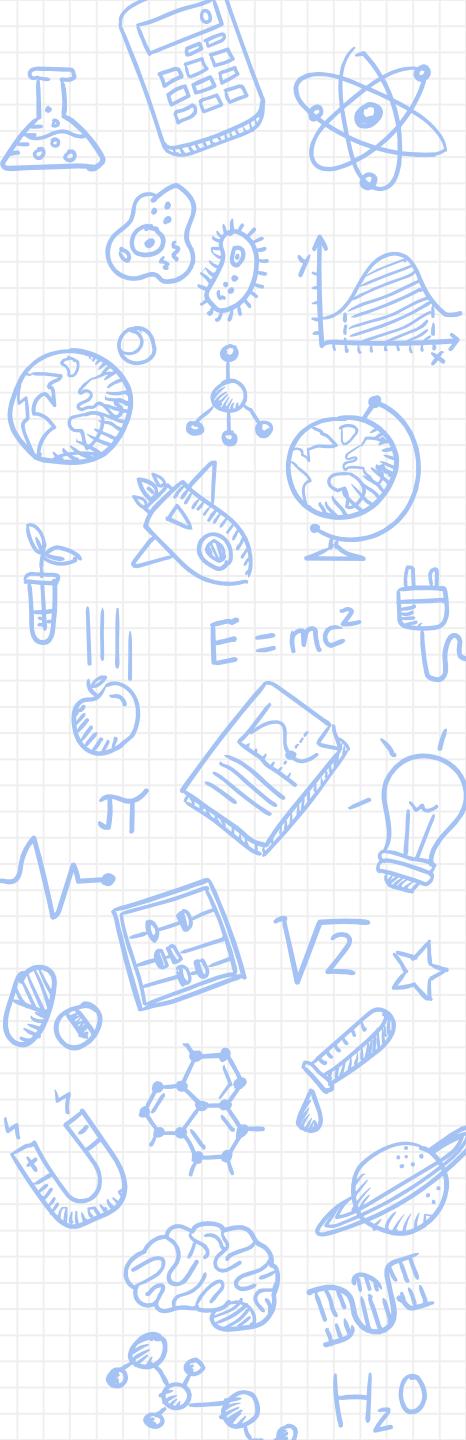

# Outline

- Arduino Reference
- Arduino 通訊協定 - UART/I<sup>2</sup>C/SPI
  - PWM - 直流馬達控制
  - 伺服馬達控制
  - 自走車組裝

# Universal Asynchronous Receiver/Transmitter

- 通用非同步收發傳輸器(Universal Asynchronous Receiver/Transmitter, UART)，例如：RS232。
- COM是電腦中異步串行通信口的簡寫，例如：COM1、COM3……等。
- Baud Rate：每秒內傳輸的訊息量，在兩個不同平台通訊時須特別注意同步。
- 補充：UART為開發版debug的好幫手。

# Universal Asynchronous Receiver/Transmitter

- 在void setup()中先設定baud rate:

*Serial.begin(9600);*

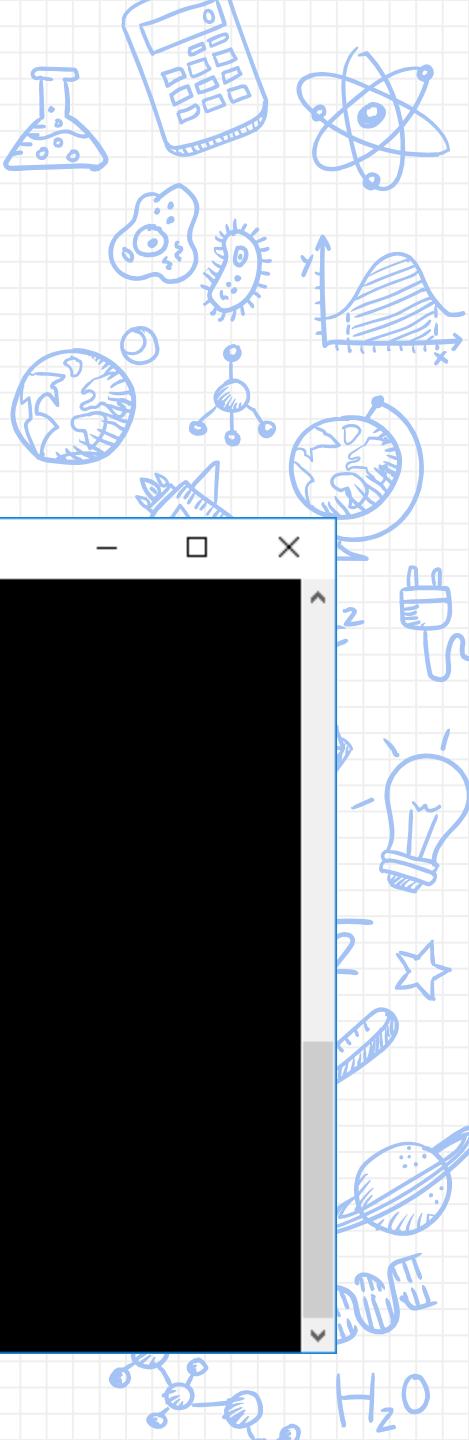

- 需要回傳資料時，再呼叫以下程式碼：

*Serial.print("COM");*

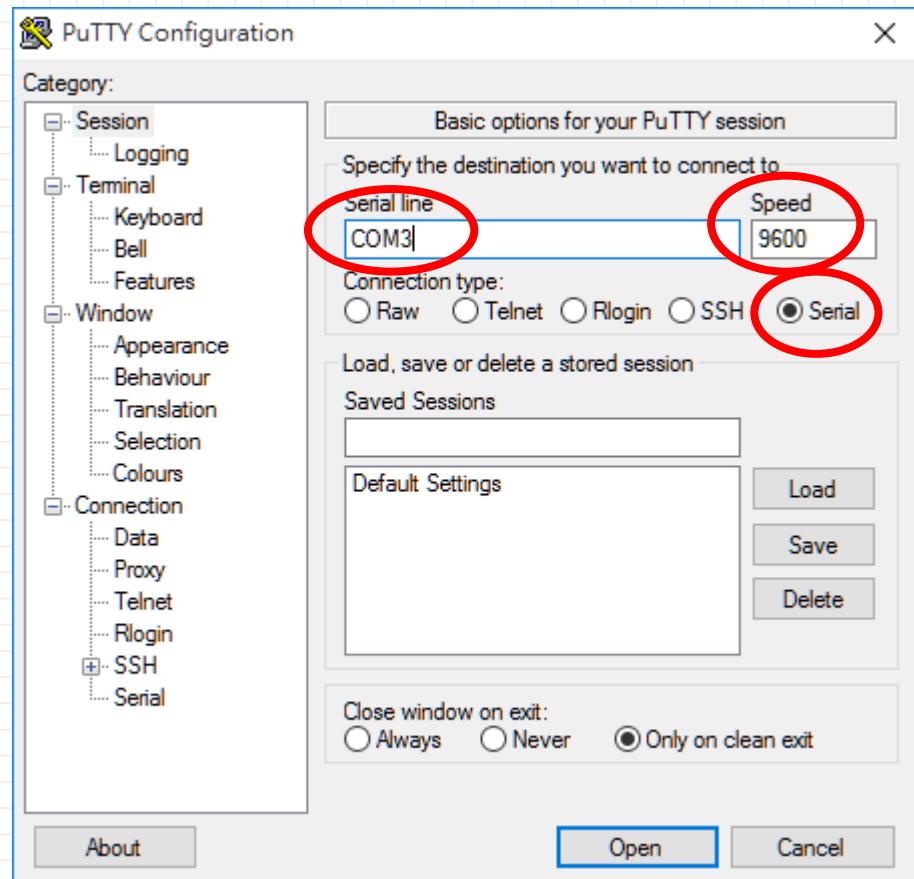

*Serial.println("COM");*

```
void setup(){  
    // 開啟 Serial port, 通訊速率為 9600 bps  
    Serial.begin(9600);  
}  
  
void loop(){  
    volt = analogRead(analogVoltageInput);  
    volt *= (5.0 / 1023.0);  
  
    Serial.print("Li-battery's Voltage = ");  
    Serial.println(volt);  
  
    delay(1000);  
}
```

# Universal Asynchronous Receiver/Transmitter

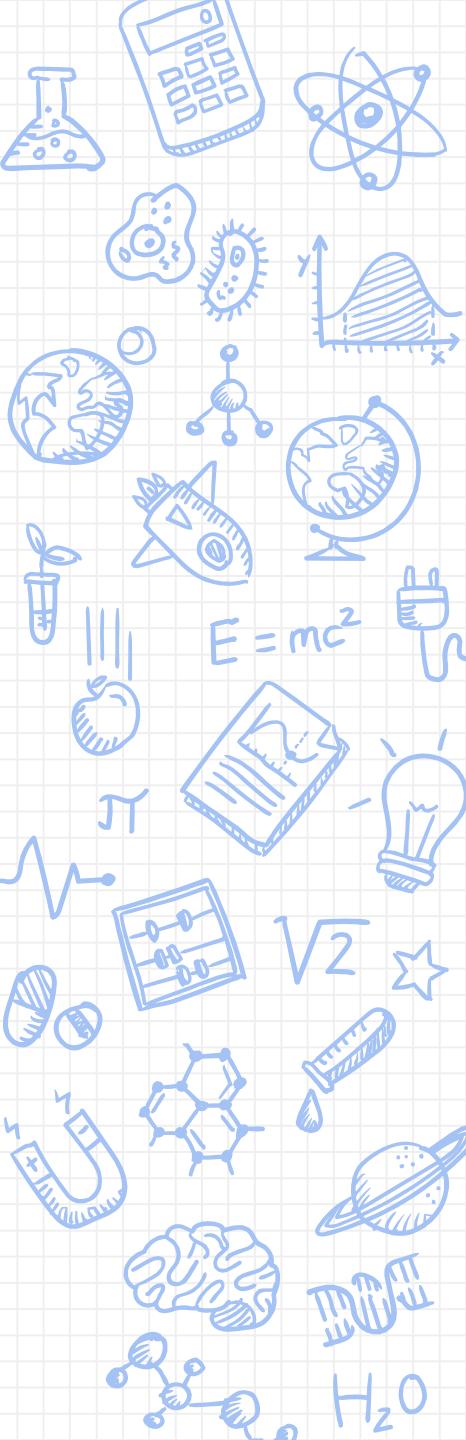

- Putty若成功設定，資料馬上可以從Arduino回傳。

A screenshot of the Putty terminal window titled 'COM3 - PuTTY'. The window displays several lines of text output from a serial connection. The text shows repeated measurements of concentration in 'pcs/0.01cf':

```
concentration = 950.09 pcs/0.01cf  
concentration = 875.55 pcs/0.01cf  
concentration = 2315.44 pcs/0.01cf  
concentration = 0.62 pcs/0.01cf  
concentration = 1828.53 pcs/0.01cf  
concentration = 527.45 pcs/0.01cf  
concentration = 1361.17 pcs/0.01cf
```

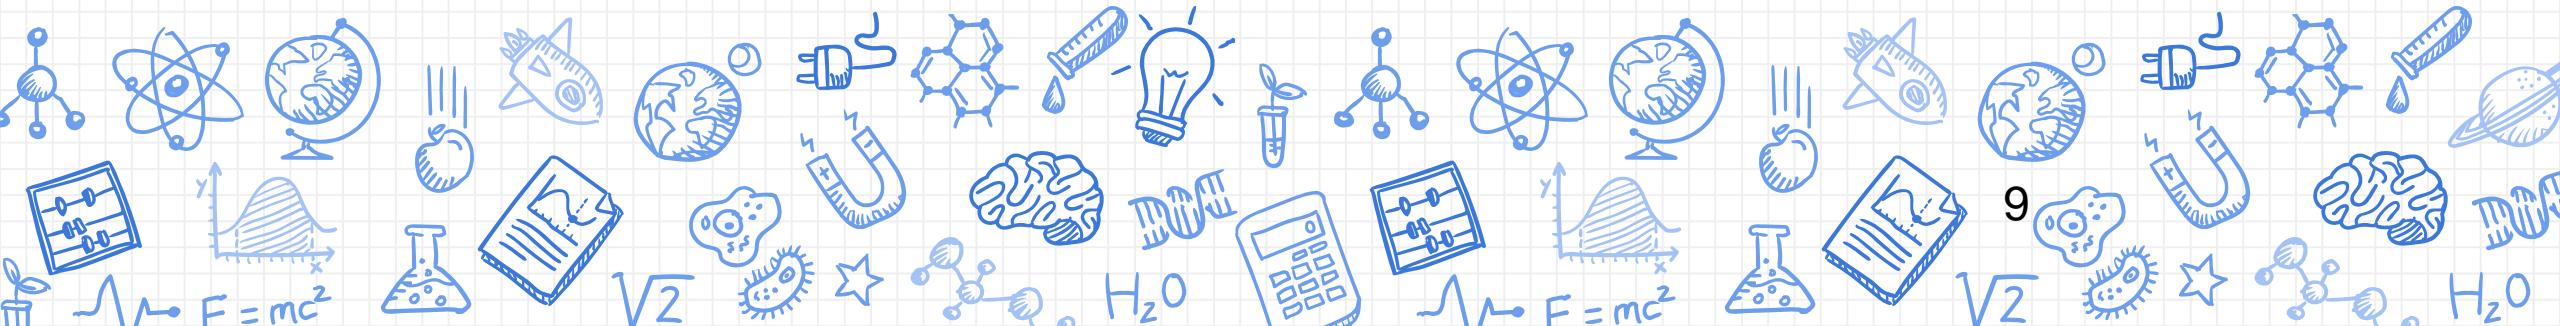

# Universal Asynchronous Receiver/Transmitter

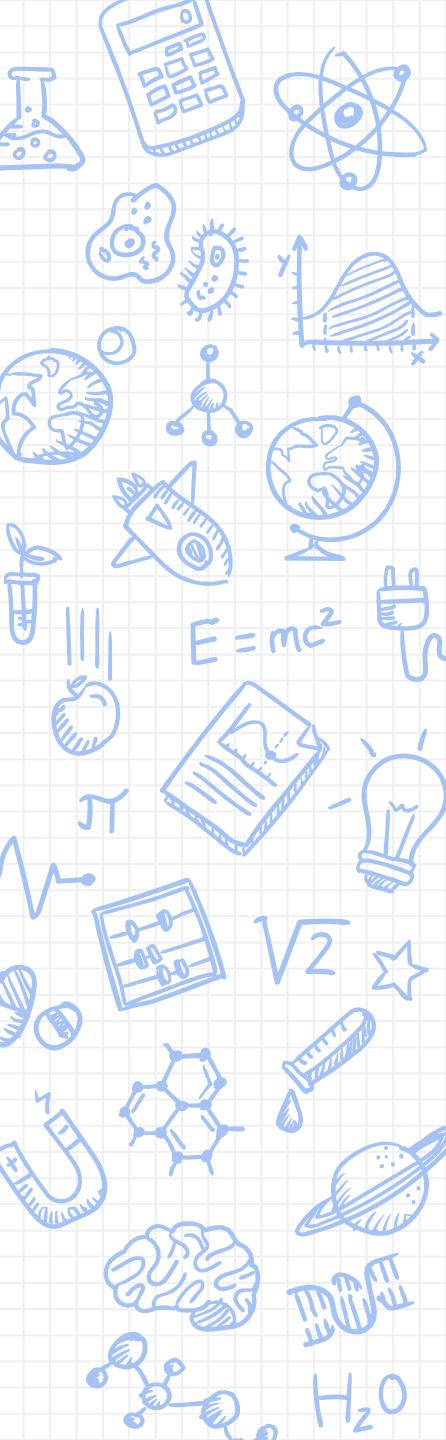

- Demo 1：使用任意starter kit提供的sensor，  
並以UART回傳偵測到的數值。

  - PWM - 直流馬達控制
  - 伺服馬達控制
  - 自走車組裝

# Inter-Integrated Circuit

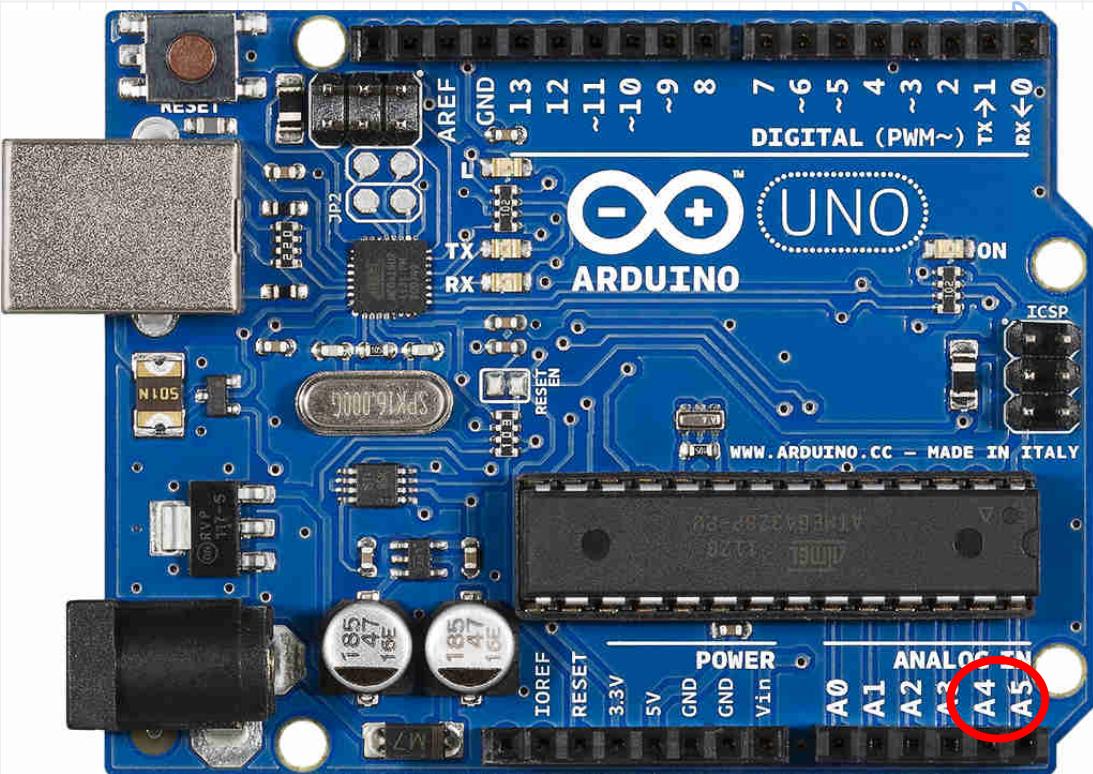

- 積體電路匯流排(Inter-Integrated Circuit, I<sup>2</sup>C)，起先為飛利浦公司為了讓主機板、嵌入式系統或手機用以連接低速週邊裝置而發展。
- I<sup>2</sup>C只使用兩條雙向漏極開路(Open Drain)：串列資料(SDA)、串列時脈(SCL)並利用電阻將電位上拉。

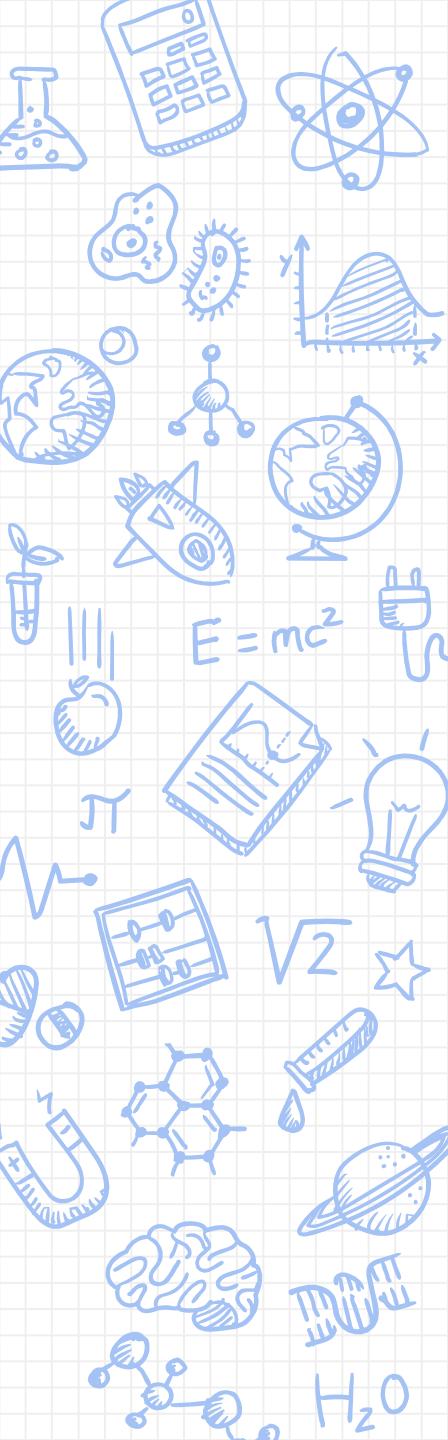

- 應用：與sensor通訊、與另一台Arduino溝通。

# Inter-Integrated Circuit

- 例子：Barometer sensor即是是以 I<sup>2</sup>C 的通訊管道與 Arduino 溝通。

# Inter-Integrated Circuit

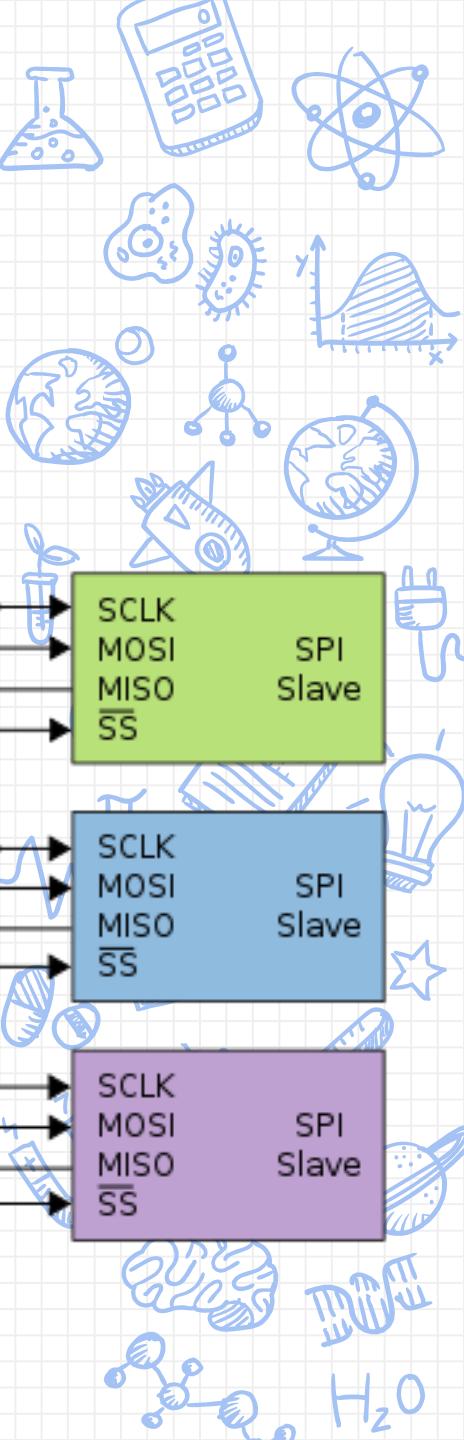

- Barometer sensor

COM3 - PuTTY

  - PWM - 直流馬達控制
  - 伺服馬達控制
  - 自走車組裝

# PWM – Pulse Width Modulation

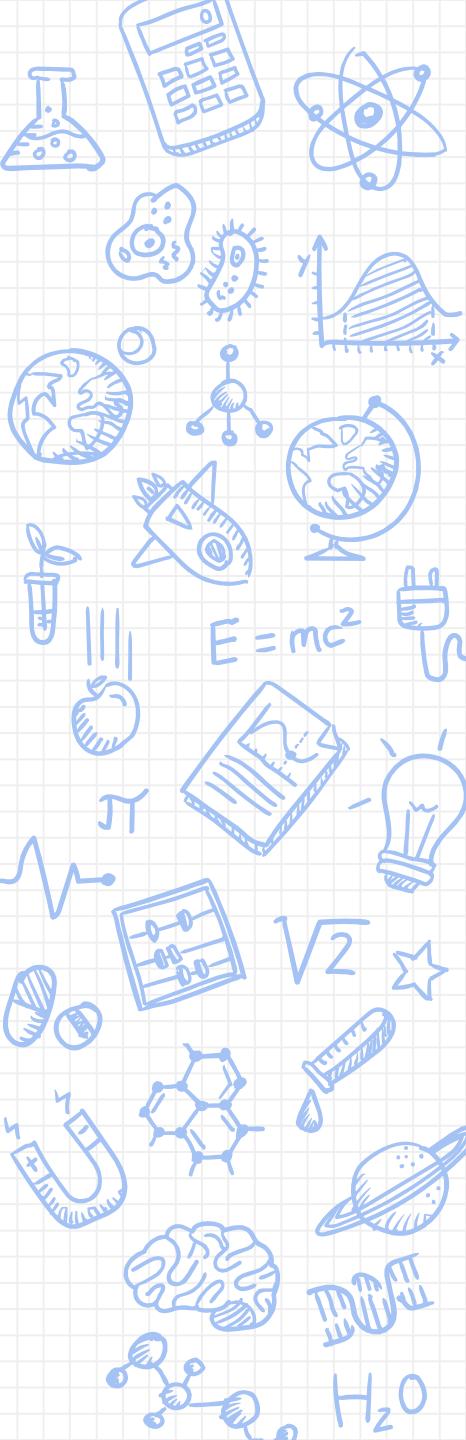

- PWM是一種具有週期性的數位訊號，在Arduino中以analog output去對digital output做控制。

# PWM – Pulse Width Modulation

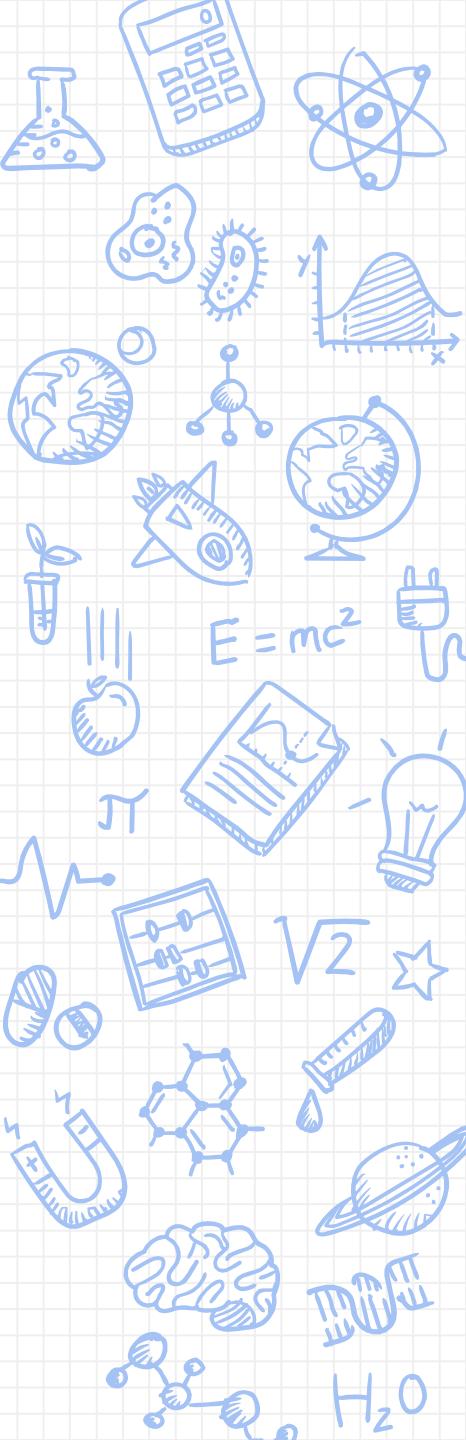

- LED漸進式明暗

```
const int LEDPin = 13;  
  
void setup() {  
    pinMode(LEDPin, OUTPUT);  
}  
  
void loop() {  
    // fade the LED from off to brightest:  
    for (int brightness = 0; brightness < 255; brightness++) {  
        analogWrite(LEDPin, brightness);  
        delay(2);  
    }  
    // fade the LED from brightest to off:  
    for (int brightness = 255; brightness >= 0; brightness--) {  
        analogWrite(LEDPin, brightness);  
        delay(2);  
    }  
    // pause between LEDs:  
    delay(100);  
}
```

# PWM – Pulse Width Modulation

- Demo 2：控制自走車直流馬達速度。  
漸進式加速  
慢速倒車  
右前方(左前方)轉彎

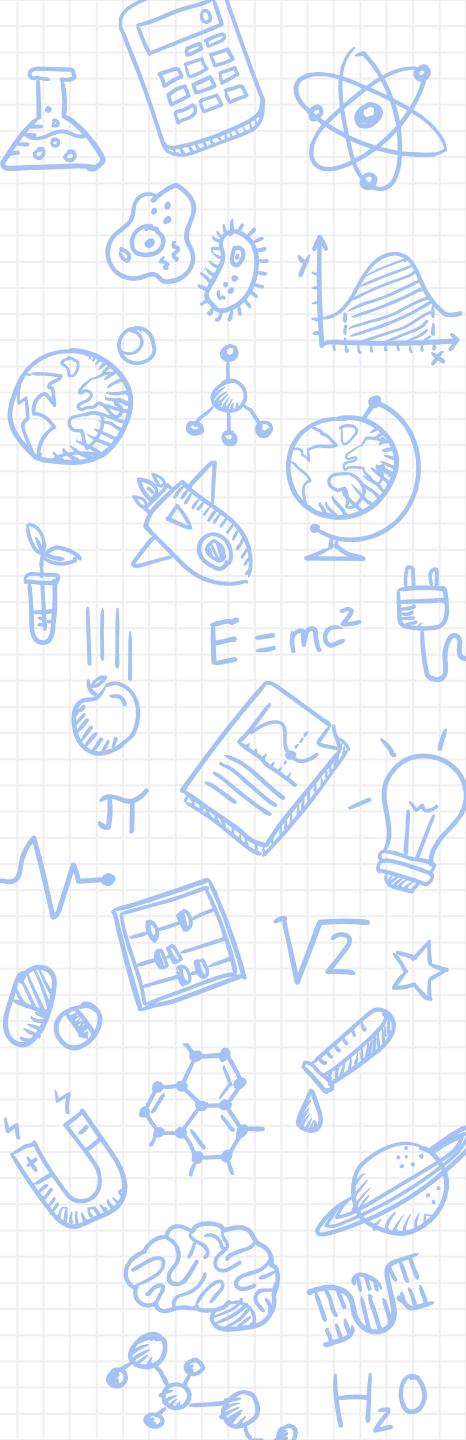

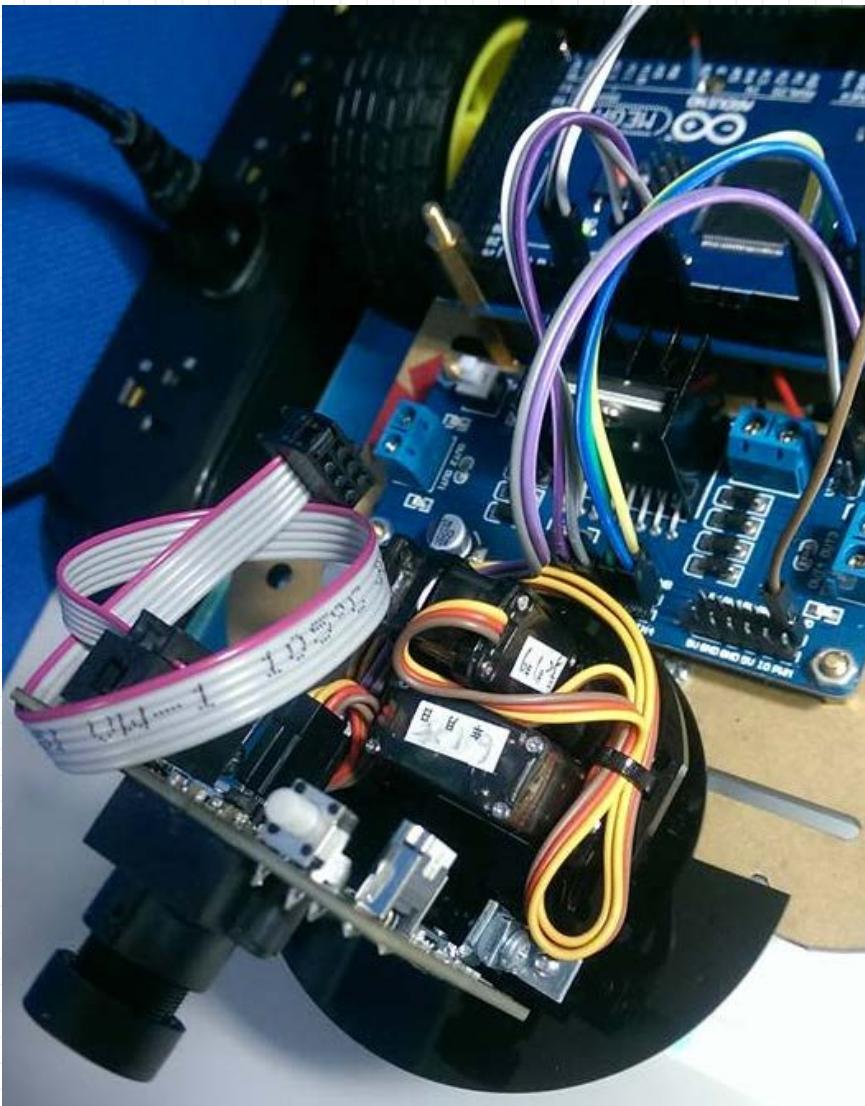

# Outline

- Arduino Reference
- Arduino 通訊協定 - UART/I<sup>2</sup>C/SPI
  - PWM - 直流馬達控制
  - 伺服馬達控制
  - 自走車組裝

# Servo馬達控制

- 伺服馬達比起步進馬達擁有更快的反應，由於可以急速啟動、急速停止，很精準的執行控制器給的訊號。
- 伺服馬達使用**類比**輸入做控制。
- 可使用範圍：  
 $0^\circ \sim 180^\circ$  (此實驗)

# Servo馬達控制

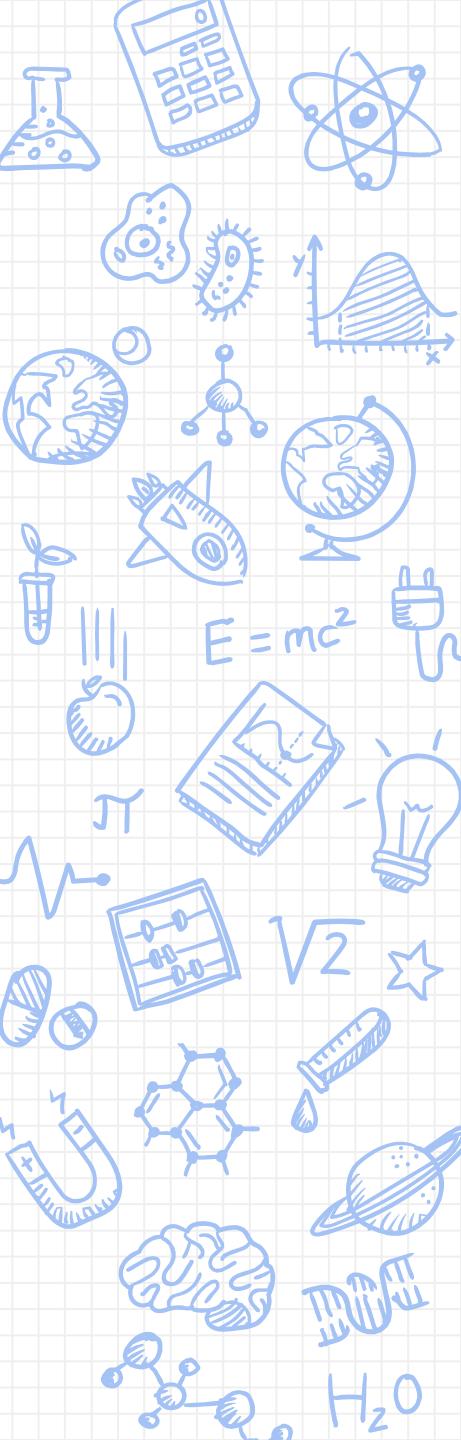

- `myservo.attach(servoPin)` , 設定servo pin。
- `myservo.write(45)` , 寫入角度，讓馬達轉到應有的位置。

```
#include <Servo.h>
Servo myservo;
const int servoPin = 51;

void setup() {
    myservo.attach(servoPin);
}

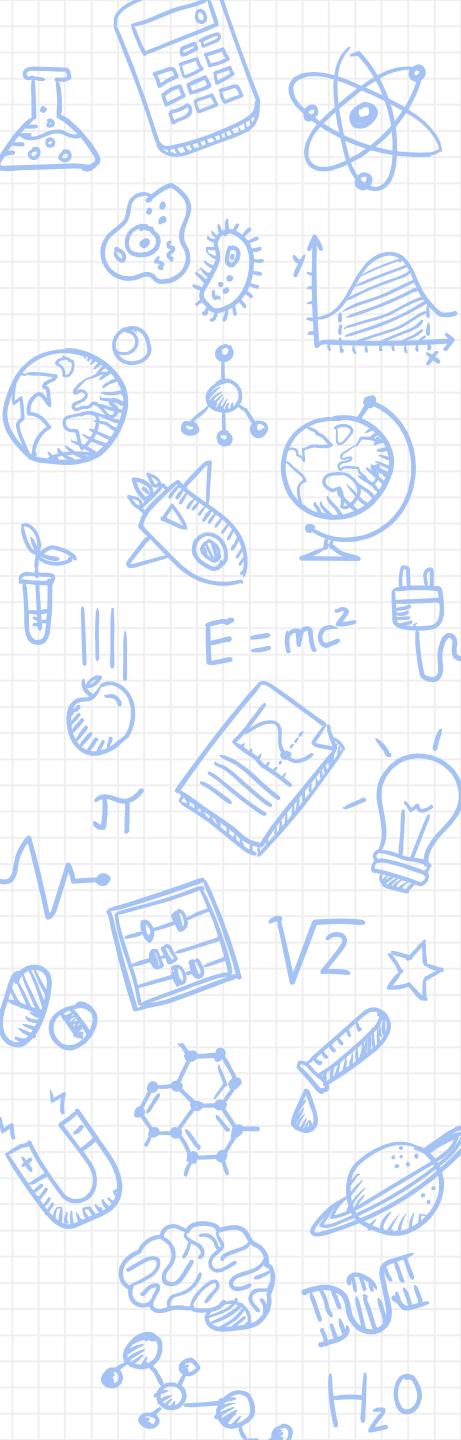

void loop() {
    myservo.write(45);
    delay(15);

    myservo.write(135);
    delay(15);
}
```

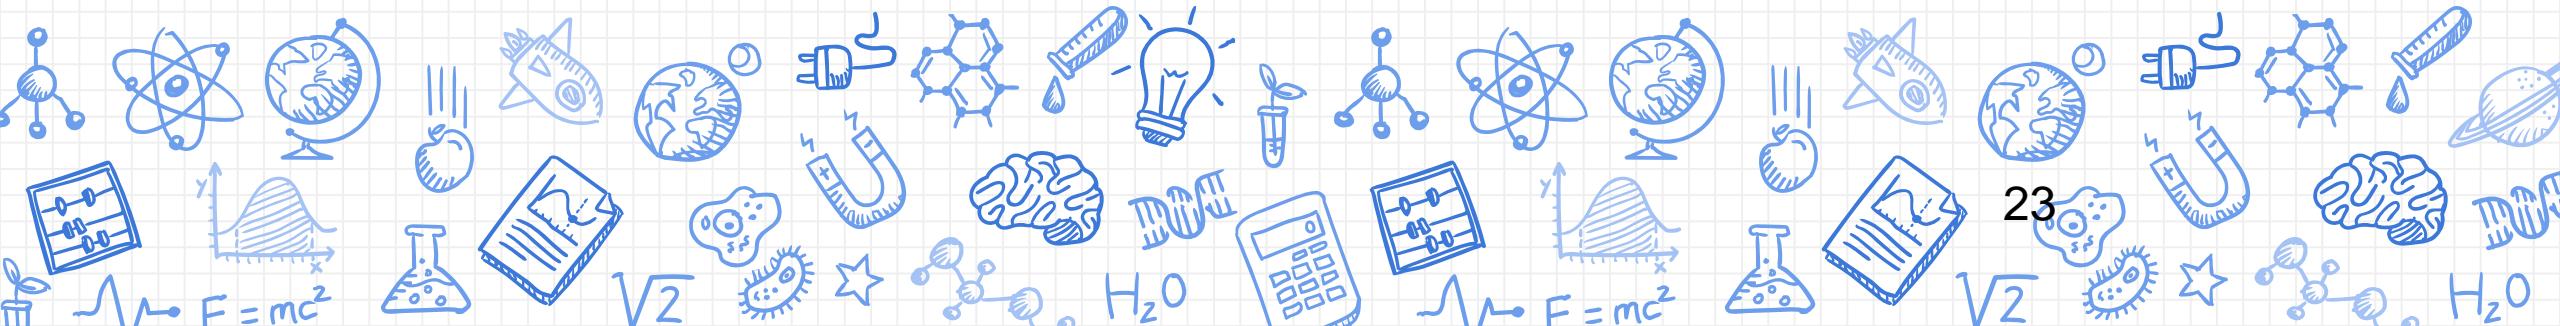

# Servo馬達控制

- Demo 3-1：操作伺服馬達。  
隨機從 $0^\circ \sim 180^\circ$  轉動，並記得每次隨機指定後，需要delay一段時間。
- Demo 3-2：操作伺服馬達。  
使用可變電阻，控制馬達位置。請記得不得超界，例如：電阻最小時對應到 $0^\circ$ ，電阻對大時對應到 $180^\circ$ 。
